Why I started building a database without SQL For years I worked with SQL, MySQL, MongoDB and the usual web database stacks. Tables, primary keys, foreign keys, indexes, joins, migrations, ORM problems, caching and security layers. At some point I kept asking myself a simple question. Does data storage really have to be this complicated? The real world is not always relational. Many systems are dynamic, connected and associative. But we often force them into tables because that is what we are used to. At the same time, I saw another problem growing. AI is changing attacks. Phishing is better. Automation is faster. Vulnerability research scales more easily. Social engineering is more believable. Database leaks are becoming more visible and more damaging. When I first worked seriously with AI about two years ago, one thing became clear to me. Many of the security mechanisms we trusted would come under pressure. So I did not only want to build a database without SQL. I wanted to build a d
